If multiline is False, the text should still not wrap even if

If multiline is True, and wrapmode is omitted, the text should wrap by word and not cause an error due to omission of the wrapmode argument.

If multiline is True and the wrapmode argument is provided, it should not cause a problem even if using the default wrapmode of 'WORD'.

If multiline is True and the wrapmode is 'CHAR', it should result in wrapping based on characters instead of words, regardless of language (i.e. even though this is designed to support scripts like Chinese and Japanese, wrapping long sentences like this in English still demonstrates functionality.)
